- State of project: extended solve() using stack DFS to get all possible paths; fix getPath(); test cases.
- I tested using simple and complex layouts, including ones requiring backtracking.
- When to use BFS (shortest path) and when DFS
- I like that it helped me learn more about the 2 most important path finding algorithms.
- I wish I had learned more about both algorithms before jumping right in, it was very difficult to figure out and understand them.
- I would improve the backtracking mechanism and add more complex layouts to test edge cases.
